This invention also relates to pharmaceutical compositions containing the compounds of the present invention as anti-microbials. The compounds are useful antimicrobial agents, effective against a number of human and veterinary pathogens, including gram-positive aerobic bacteria such as multiply-resistant staphylococci, streptococci and enterococci as well as anaerobic organisms such as *Bacterioides* spp. and *Clostridia* spp. species, and acid fast organisms such as *Mycobacterium tuberculosis*, *Mycobacterium avium* and *Mycobacterium* spp.

## OXAZOLIDINONE DERIVATIVES AS ANTIMICROBIALS

### FIELD OF THE INVENTION

The present invention relates to certain substituted phenyl oxazolidinones and to processes for the synthesis of the same. This invention' also relates to pharmaceutical compositions containing the compounds of the present invention as antimicrobials. The compounds are useful antimicrobial agents, effective against a number of human and veterinary pathogens, including gram-positive aerobic bacteria such as multiply-resistant staphylococci, streptococci and enterococci as well as anaerobic organisms such as *Bacterioides* spp. and *Clostridia* spp. species, and acid fast organisms such as *Mycobacterium tuberculosis*, *Mycobacterium avium* and *Mycobacterium* spp.

### BACKGROUND OF THE INVENTION

Increasing antibacterial resistance in Gram positive bacteria has presented a formidable treatment problem. The enterococci, although traditionally non virulent pathogens, have been shown, when associated with Vancomycin resistance, to have an attributable mortality of approximately 40%. *Staphylococcus aureus*, the traditional pathogen of post operative wounds, has been resistant to Penicillin due to production of penicillinases. This resistance was overcome by the development of various penicillinase stable  $\beta$  lactams. But the pathogen responded by synthesizing a modified target penicillin binding protein- 2' leading to less affinity for  $\beta$  lactam antibiotics and a phenotype known as Methicillin Resistant *S. aureus* (MRSA). These strains, till recently were susceptible to Vancomycin, which inspite of its various drawbacks, has become the drug of choice for MRSA infections. *Streptococcus pneumoniae* is a major pathogen causing

pneumonia, sinusitis and meningitis. Until very recently it was highly susceptible to penicillin. Recently though, different PBP 2' strains with different susceptibility to penicillin have been reported from across the globe.

Oxazolidinones are a new class of synthetic antimicrobial agents which kill gram positive pathogens by inhibiting a very early stage of protein synthesis. Oxazolidinones inhibit the formation of ribosomal initiation complex involving 30S and 50S ribosomes leading to prevention of initiation complex formation. Due to their novel mechanism of action, these compounds are active against pathogens resistant to other clinically useful antibiotics.

#### 10 SUMMARY OF THE INVENTION

The objective of this invention is to synthesize, identify and profile oxazolidinone molecules which have good activity against multiply resistant gram positive pathogens like MRSA, VRE and PRSP. Some of these molecules have activity against MDR-TB and MAI strains, while others have significant activity against important anaerobic  
15 bacteria.

The compounds of the present invention are related by their substituted phenyloxazolidinone ring structure in the compounds disclosed to the publications described above except that the subject compounds have a diazine moiety attached to the phenyloxazolidinone which is further substituted by heterocyclic, aryl, substituted aryl,  
20 heteroaromatic ring therefore the compounds are unique and have superior antibacterial activity.

Another object of the present invention is to provide processes for the novel phenyloxazolidinones derivatives that exhibit significantly greater antibacterial activity, than available with the present compounds against multiply resistant gram positive pathogens like MRSA, VRE and PRSP against MDR-TB and MAI strains, in order to provide safe and effective treatment of bacterial infections.

For preparing pharmaceutical compositions from the compounds described by this invention, inert, pharmaceutically acceptable carriers can be either solid or liquid. Solid  
20       form preparations include powders, tablets, dispersible granules, capsules, cachets,

suppositories, and ointments. A solid carrier can be one or more substances which may also act as diluents, flavouring agents, solubilizers, lubricants, suspending agents, binders, or tablets disintegrating agents; it can also be as finely divided solid which is in admixture with the finely divided active compound. For the preparation of tablets, the active compound is mixed with carrier having the necessary binding properties in suitable proportions and compacted in the shape and size desired. The powders and tablets preferably contain from about 5 to about 70 percent of the active ingredient. Suitable solid carriers are lactose, pectin, dextrin, starch, gelatin, tragacanth, low melting wax, cocoa butter, and the like. The term "preparation" is intended to include the formulation of the active compound with encapsulating material as carrier providing a capsule in which the active component (with or without other carriers) is surrounded by carrier, which is thus in association with it. Similarly, capsules can be used as solid dosage forms suitable for oral administration.

Liquid form preparations include solutions, suspensions, and emulsions. As an example may be mentioned water or water-propylene glycol solutions for parenteral injection. Such solutions are prepared so as to be acceptable to biological systems (isotonicity, pH, etc.). Liquid preparations can also be formulated in solution in aqueous polyethylene glycol solution. Aqueous solutions suitable for oral use can be prepared by dissolving the active component in water and adding suitable colorants, flavours, stabilizing, and thickening agents as desired. Aqueous suspension suitable for oral use can be made by dispersing the finely divided active component in water with viscous

material, i.e., natural or synthetic gums, resins, methyl cellulose, sodium carboxymethyl cellulose, and other well-known suspending agents.

Ointment preparations contain heavy metal salts of a compound of Formula I with a physiologically acceptable carrier. The carrier is desirably a conventional water-dispersible hydrophilic or oil-in-water carrier, particularly a conventional semi-soft or cream-like water-dispersible or water soluble, oil-in-water emulsion infected surface with a minimum of discomfort. Suitable compositions may be prepared by merely incorporating or homogeneously admixing finely divided compounds with the hydrophilic carrier or base or ointment.

Preferably, the pharmaceutical preparation is in unit dosage form. In such form, the preparation is subdivided into unit doses containing appropriate quantities of the active component. The unit dosage form can be a packaged preparation, the package containing discrete capsules, powders in vials or ampoules, and ointments capsule, cachet, tablet, gel, or cream itself or it can be the appropriate number of any of these packaged forms.

The quantity of active compound in a unit dose of preparation may be varied or adjusted from less than 1 mg to 100 mg according to the particular application and the potency of the active ingredient.

In therapeutic use as agents for treating bacterial infections the compounds utilized in the pharmaceutical method of this invention are administered at the initial dosage of about 3 mg to about 40 mg per kilogram daily. The dosages, however, may be

varied depending upon the requirements of the patient and the compound being employed. Determination of the proper dosage for a particular situation is within the smaller dosages which are less than the optimum dose. Small increments until the optimum effect under the daily dosage may be divided and administered in portions during the day if desired.

In order to achieve the above mentioned objects in accordance with the purpose of the invention as embodied and broadly described herein, there are provided process for the synthesis of compounds of Formulae I, II, III and IV. Pharmaceutically acceptable non-toxic acid addition salts of the compounds of the present invention of Formulae I, II, III and IV may be formed with inorganic or organic acids, by methods well known in the art.

The present invention also includes within its scope prodrugs of the compounds of Formulae I, II, III and IV. In general, such prodrugs will be functional derivatives of these compounds which readily get converted in vivo into defined compounds. Conventional procedures for the selection and preparation of suitable prodrugs are known.

FORMULA V

identified as five different cores, namely

-(S)-N-[[3-[3-Fluoro-4-(N-piperazinyl)phenyl]-2-oxo-5-oxazolidinyl]methyl]acetamide (core I);

-(S)-N-[[3-[3-Fluoro[4-[3-(1 $\alpha$ ,5 $\alpha$ ,6 $\alpha$ )-6-[N-methyl]amino]-3-azabicyclo-[3.1.0]hexane]phenyl]-2-oxo-5-oxazolidinyl]methyl]acetamide (core II);

-(S)-N-[[3-[3-Fluoro[4-[3-(1 $\alpha$ ,5  $\alpha$ ,6  $\alpha$ )-6-[N-methyl] amino methyl]-3-azabi-  
cyclo-[3.1.0]hexane]phenyl]-2-oxo-5-oxazolidinyl] methyl]acetamide (core III);

-(S)-N-[[3-[4-[4-N-methylamino piperidin-1-yl]-3-fluorophenyl]-2-oxo-oxazolid-  
in-5-yl]methyl acetamide (core IV); and,

methyl] acetamide (core V),

were used for analoguing purposes.

Key intermediate amines of Formula V for the analogue preparation were  
prepared from commercially available reagents wherein G in amines of Formula V is  
10       defined as NH, CH(NHR), -CH-CH<sub>2</sub>NHR wherein R is H, ethyl, methyl, isopropyl,  
acetyl, cyclopropyl, alkoxy, or acetyl and U, V, Y and Z are as defined for Formula II.  
Some amines of Formula V are already known in the literature and are given by reference  
and if they have been made for the first time or by a different procedures or variation of  
known procedure they are described in detail in the experimental section.

15       Optically pure amines of Formula V could be obtained either by one of a number  
of asymmetric syntheses or alternatively by resolution from a racemic mixture by selective  
crystallization of a salt prepared, with an appropriate optically active acid such as  
dibenzoyl tartrate or 10-camphorsulfonic acid, followed by treatment with base to afford  
the optically pure amine.

20       The compounds of the present invention represented by general Formula I may be  
prepared by the method of reaction in Scheme I:

## SCHEME-I

FORMULA V

FORMULA I

In Scheme I, the heteroaromatic group with the corresponding appendage can be introduced on the nitrogen atom of ring C of compounds of Formula V by one of the

methods described below to given Formula I, wherein  $R_{12}$  is a suitable leaving group well known to one of ordinary skill in the art such as fluoro, chloro, bromo,  $SCH_3$ ,  $-SO_2CH_3$ ,  $-SO_2CF_3$  or  $OC_6H_5$  etc. and G in amines of Formula V is defined as  $NH$ ,  $CH(NHR_{13})$ ,  $-CH-CH_2NHR_{13}$  wherein  $R_{13}$  is H, ethyl, methyl, isopropyl, acetyl, cyclopropyl, alkoxy or acetyl U, V, Y and Z are as defined for Formula I earlier.

Amine of structure of Formula V is reacted with a heteroaromatic compound of Formula R-T-W- $R_{12}$  wherein R, T, W are the same as defined for Formula I earlier. For the preparation of compounds of Formula I when W is equal to  $CH_2$  corresponding aldehyde can be used through a process of reductive amination and is attached to amine of Formula V.

Similarly, for the preparation of compound of Formula I wherein W is equal to  $C=O$  corresponding acid can be used and the amino of Formula V can be acylated through activated esters in the presence of condensing agents such as 1,3-dicyclohexylcarbodiimide (DCC) and 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide (EDC). Other methods of acylation can also be employed.

Alternatively, the compounds having carbonyl link can also be made by reacting heteroaromatic compound of the Formula VI

FORMULA VI

such as N- methyl pyrrole with the intermediate amine of Formula V in the presence of triphosgene or phosgene. Carbonyl linkers may also be introduced between hetero-aromatic compound such as 3- bromothiophene and amine of Formula V with carbon monoxide and the catalyst such as Pd (PPh<sub>3</sub>)<sub>2</sub>Cl<sub>2</sub>. Extended chain pyrroles having  
5 dicarbonyl linkers can also be obtained from treatment with oxalyl chloride and amine of the Formula V.

The reduction of the carbonyl linkers using the standard reducing agents results in the formation of methylene linkers.

Preparation of the compound of Formula I as represented by Formula II (where  
10 heterocycle is 5 membered ring) is accomplished as exemplified below by three methods A, B and C as shown in Scheme II:

## SCHEME- II

FORMULA V

FORMULA VI

FORMULA II

**Method A:**

Amine of structure V is reacted with a heteroaromatic compound of Formula VI having  $R_{12}$  as a suitable leaving group defined earlier for Scheme I. Q, P and M are as defined for Formula II.

5           The reaction is done in a suitable solvent such as dimethylformamide, dimethylacetamide, ethanol or ethylene glycol at a suitable temperature in the range of -70°C to 180°C to afford compounds of Formula I. The presence of a suitable base such as triethylamine, diisopropyl amine, potassium carbonate, sodium bicarbonate is useful in some cases to improve the yield of the reaction.

10           **Method B:**

          Reductive alkylation of the amine intermediate of Formula V, with the corresponding heterocyclic aldehydes of the Formula VI, such as furaldehyde (Q, P = H, M=O;  $R_{12}$  is CHO) using known reducing agents well known to one of ordinary skill in the art such as sodium triacetoxyborohydride or sodium cyanoborohydride gave the  
15           products of Formula II wherein  $W=CH_2$  as shown in the Scheme II.

**Method C :**

          Acylation of intermediate amines of Formula V with heterocyclic acid of Formula VI, such as 2- furoic acid ( Q,P = H; M=O,  $R_{12} =COOH$ ) gave products of Formula II, wherein  $W=CO$ , as shown in the Scheme II wherein U, V, Y, Z, X, W, M, P, Q and  $R_{12}$   
20           are the same.

-(S)-N[[3-[3-Fluoro-4-[N-1[4-(5-nitro-2-thienoyl)]piperazinyl]phenyl]2-oxo-5-oxazolidinyl)methyl] acetamide hydrochloride was prepared using this method.

Alternatively, the compounds having carbonyl link can also be made by reacting heteroaromatic compound of the Formula VI such as N- methyl pyrrole with the  
5 intermediate amine of Formula V in the presence of triphosgene or phosgene. Carbonyl linkers may also be introduced between heteroaromatic compound such as 3-bromothiophene and amine of Formula V with carbon monoxide and the catalyst such as Pd ( PPh <sub>3</sub> )<sub>2</sub>Cl<sub>2</sub>. Extended chain pyrroles having dicarbonyl linkers can also be obtained from treatment with oxalyl chloride and amine of the Formula V.

10 The reduction of the carbonyl linkers using the standard reducing agents results in the formation of methylene linkers.

The in vitro antibacterial activity of the compounds were demonstrated by the agar incorporation method (NCCLS M 7 and M 100-S8 documents). Briefly, the compounds were dissolved in DMSO and doubling dilution of the compounds were incorporated into Mueller Hilton agar before solidification. Inoculum was prepared by suspending 4 to 5 colonies into 5 ml of normal saline solution and adjusting the turbidity to 0.5 Macfarland turbidity standard tables ( $1.5 \times 10^8$  CFU/ml), after appropriate dilutions,  $10^4$  CFU/spot was transferred into the surface of dried plate and incubated for 18 hours (24 hours for MRSN studies). The concentration showing no growth of the inoculated culture was recorded as the MIC. Appropriate ATCC standard strains were simultaneously tested and result recorded only when the MIC's against standard antibiotics were within the acceptable range.

The compounds of the present invention represented by general Formula I may be prepared by the method of reaction in Scheme I. Key intermediate amines of Formula V for the analogue preparation were prepared by the synthetic procedures described below from commercially available reagents. The compounds of Formula I were made by either Method A, B, or C.

Amines already known in the literature are given by reference and if they have been made by a different procedures they are described in detail.

Mainly five different amines of Formula V identified as five different cores namely

(S)-N-[[3-[3-Fluoro-4-(N-piperazinyl)phenyl]-2-oxo-5-oxazolidinyl] methyl] acetamide (core I),

(S)-N-[[3-[3-Fluoro[4-[3-(1 $\alpha$ ,5 $\alpha$ ,6 $\alpha$ )-6-[N-methyl]amino]-3-azabicyclo-

Most of the compounds were characterized using NMR, IR and were purified  
by chromatography. Crude products were subjected to column chromatographic  
purification using silica gel (100-200 or 60-120 mesh) as stationery phase.

The examples mentioned below demonstrate the general synthetic procedure  
15 as well as the specific preparation for the preparation for the preferred compound.  
The examples are given to illustrate the details of the invention and should not be  
constrained to limit the scope of the present invention.

### EXAMPLE 1

20 **Analogues of (S)-N-[[3-[3-Fluoro-4-(N-piperaziny]phenyl]-2-oxo-5-  
oxazolidinyl]methyl] acetamide(core I)**

The heteroaromatic group with the corresponding appendage can be  
introduced on the nitrogen atom of ring C of compounds of Formula I by one of the  
methods described below:

**Method-A:**

General procedure:

Amine of structure of Formula V is reacted with a heteroaromatic compounds of Formula VI having corresponding R<sub>12</sub> appendages such as -CH<sub>2</sub>R<sub>13</sub>, -COR<sub>13</sub> or -CH(CH<sub>3</sub>)R<sub>13</sub> wherein R<sub>13</sub> is a suitable leaving group well known to one of ordinary skill in the art such as fluoro, chloro, bromo, SCH<sub>3</sub>, -SO<sub>2</sub>CH<sub>3</sub>, -SO<sub>2</sub>CF<sub>3</sub> or OC<sub>6</sub>H<sub>5</sub> etc..

The reaction is done in a suitable solvent such as dimethylformamide, dimethylacetamide, ethanol or ethylene glycol at a suitable temperature in the range of -78°C to 180°C to afford compounds of Formula II. The presence of a suitable base such as triethylamine, diisopropyl amine, potassium carbonate, sodium bicarbonate is useful in some cases to improve the yield of the reaction.

The following compounds were made following this method:

To this was added K<sub>2</sub>CO<sub>3</sub> (2.47g; 17.87 mmol) and furoyl chloride (0.56 g, 10.68 mmol). The reaction mixture was stirred at 25°C for 5.0 hr. TLC of the reaction mixture was monitored. A faster moving spot was observed. Solvent was removed and the residue was dissolved in dichloromethane, washed with water, dried over sodium sulphate, and solvent was removed.
